SCHOOL OF INFOCOMM TECHNOLOGY

## Lists

### **Programming I (PRG1)**

Diploma in Information Technology

Diploma in Financial Informatics

Diploma in Information Security & Forensics

Year 1 (2018/19), Semester 1

# Objectives

At the end of this lecture, you will learn how to:

- Create Lists
- Process Lists using List operators and methods

# What is List

- A **list** is considered a sequence type in Python, similar to Strings.
- A list is a **sequence of values**.
- In a string, the values are characters.
- In a list, the values can be **any type**.
- Values in a list are called **elements** or items.

**string friend**

**list friends**

# Examples of List

- The names of your friends
- A list of students' marks
- A shopping list
- A recipe – a list of instructions
- A text document – a list of lines

|         |      |
|---------|------|
| Peter   | 84.7 |
| David   | 71   |
| Vincent | 55   |
| Hafiz   | 80   |
| Janet   | 63   |
| Albert  | .... |
| ....    |      |

|                                |
|--------------------------------|
| S9099885K;Ang PS;98765432      |
| S9177885P;David Davis;89778899 |
| S9267890A;Lim Vincent;91990099 |
| S9111199Q;Tan SS;88995566      |
| ....                           |

# Creating a List

- Enclose the elements in square brackets, separate each element by commas.

E.g.           [ ]  
                  [ 'Peter', 'John', 'Mary', 'David' ]  
                  [ 89, 77, 55, 69 ]

- Usually we assign the list to a variable name so that we can refer to the list subsequently:

E.g.           emptyList = [ ]  
                 friendsList = [ 'Peter', 'John', 'Mary', 'David' ]  
                 marksList = [ 89, 77, 55, 69 ]

# Creating a List

- An element in a list can be another list – *nested list*.  
E.g. `friendsList = ['Peter', ['John', 'Mary'], 'David']`  
`matrix = [ [1,2,3], [4,5,6], [7,8,9] ]`
- A list that contains no elements is called an empty list.  
E.g. `emptyList = [ ]`
- A list may contain *elements of different types*.  
E.g. `mixedList = ['Peter', 100, 23.5, [10, 20]]`

# Basic Operators for List

- Use the **bracket operator [n]** to access an element in the list.
- Use the **[n:m] operator** to access part of the list from index n to m.
- Usage is similar to Strings

```
>>> list1 = [1,2,3,4,5]
>>> list1
[1, 2, 3, 4, 5]
```

```
>>> list1[0]
1
>>> list1[1]
2
>>> list1[-1]
5
>>> list1[1:3]
[2, 3]
>>> list1[3:]
[4, 5]
>>> list1[:3]
[1, 2, 3]
```

```
>>> friends = ['Peter', 'John', 'Mary', 'David']
>>> friends[1:3]
['John', 'Mary']
```

# Basic Operators for List

- The **+** operator concatenates lists.
- The **in** operator detects the presence of an element in the list.
- The **==** operator compares the equality of two lists

```
>>> list1 = [1,2,3,4,5]
>>> list2 = ['a','b','c']
>>> list1 + list2
[1, 2, 3, 4, 5, 'a', 'b', 'c']
```

```
>>> 1 in list1
True
>>> 1 in list2
False
```

```
>>> list3 = [1,2,3,4,5]
>>> list1 == list2
False
>>> list1 == list3
True
```

# Basic Functions for List

- The function **len()** returns the number of elements in the list.
- The function **min()** returns the smallest element in the list.
- The function **max()** returns the largest element in the list.

```
>>> list1 = [1,2,3,4,5]
>>> len(list1)
5
```

```
>>> min(list1)
1
```

```
>>> max(list1)
5
```

# Activity 1

- Create a list called marksList that contains 10 elements.
- Display the value in the first element of marksList.
- Add the values in the last two elements of marksList and assign the result to the variable sum.
- Double the value in the second element of marksList.

# Built-in List methods

| Methods                   | Description  | Example  |
|---------------------------|--|--|
|                           |  | <code>letters=['a', 'b']</code>  |
| <code>append(x)</code>    | Add an element, x, to the end of the list.                       | <code>letters.append('c')</code><br><code>letters</code><br><code>['a', 'b', 'c']</code>                       |
| <code>extend(L)</code>    | Extend the list by appending all the items in the given list, L. | <code>letters.extend(letters)</code><br><code>letters</code><br><code>['a', 'b', 'c', 'a', 'b', 'c']</code>    |
| <code>insert(i, x)</code> | Insert an item, x, before the given position i in the list.      | <code>letters.insert(3,'z')</code><br><code>letters</code><br><code>['a', 'b', 'c', 'z', 'a', 'b', 'c']</code> |

# Built-in List methods

| Methods          | Description  | Example   |
|------------------|--|---|
|                  |  | letters is the list<br>['a', 'b', 'c', 'z', 'a', 'b', 'c']  |
| <b>remove(x)</b> | Remove the first item from the list whose value is x. Error occurs if x is not in the list.  | <b>letters.remove('c')</b><br>letters<br>['a', 'b', 'z', 'a', 'b', 'c']<br><b>letters.remove('d')</b><br><b>ValueError:</b><br><b>list.remove(x): x not in list</b> |
| <b>pop([i])</b>  | Remove the item at the given position in the list and return it.<br>Removes and returns the last item in the list if the argument is not stated. | <b>letters.pop(2) → 'z'</b><br>letters<br>['a', 'b', 'a', 'b', 'c']<br><b>letters.pop() → 'c'</b><br>letters<br>['a', 'b', 'a', 'b']                                |

# Built-in List methods

| Methods          | Description  | Example   |
|------------------|--|---|
|                  |  | Letters is the list<br>['a', 'b', 'a', 'b']   |
| <b>index(x)</b>  | Return the index in the list of the first item whose value is x. Error occurs if x is not in the list. | <b>letters.index('a') → 0</b><br><b>letters.index('c')</b><br><b>ValueError: 'c' is not in list</b> |
| <b>count(x)</b>  | Return the number of times x appears in the list.  | <b>letters.count('a') → 2</b>   |
| <b>reverse()</b> | Reverse the elements of the list in place.   | <b>letters.reverse()</b><br>letters<br>['b', 'a', 'b', 'a']   |
| <b>sort()</b>    | Sort the items of the list in place.   | <b>letters.sort()</b><br>letters<br>['a', 'a', 'b', 'b']  |
| <b>clear()</b>   | Remove all items from the list.  | <b>letters.clear()</b>  |

# Try-Outs

- Given that the list firstList and secondList are created as follows:
  - **firstList = [ 2, 4, 6, 8, 10 ]**
  - **secondList = [ 2, 4, 6, 8, 10 ]**

Evaluate the outputs in the following pages

# Evaluate

| Program Text                       | Output |
|------------------------------------|--------|
| <code>print(firstList[1])</code>   |        |
| <code>print(firstList[-1])</code>  |        |
| <code>print(firstList[5])</code>   |        |
| <code>print(firstList[1:3])</code> |        |
| <code>print(firstList[:3])</code>  |        |
| <code>print(firstList[3:])</code>  |        |
| <code>print(firstList)</code>      |        |

# Evaluate

| Program Text   | Output |
|--|--------|
| <pre>print(len(firstList))</pre>   |        |
| <pre>print(secondList)</pre>   |        |
| <pre>print(firstList == secondList)</pre>  |        |
| <pre>for each in firstList:<br/>    print(each)</pre>  |        |
| <pre>prifor i in range(len(secondList)):<br/>    secondList[i] = secondList[i] + 1<br/>    print(secondList)</pre> |        |
| <pre>thirdList = firstList + secondList<br/>print(thirdList)</pre>   |        |

# Evaluate

| Program Text  | Output |
|---|--------|
| <pre>print(5 in firstList) print(5 in secondList)</pre>   |        |
| <pre>fourthList = firstList for i in range(len(fourthList),2):     fourthList[i] = fourthList[i] * 2     print(fourthList) print(firstList)</pre> |        |

# Activity 2

- You will have some practice with processing and manipulating strings and lists, via Coursemology.
